pandas DataFrame

pandas Series

- A 1-dimensional labeled array
- Supports many data types
- Axis labels → index
 - get and set values by index label
- Valid argument to most NumPy methods

pandas DataFrame

- A 2-dimensional labeled data structure
- A dictionary of Series objects
 - Columns can be of potentially different types
 - Optionally parameters for fine-tuning:
 - index (row labels)
 - columns (column labels)

Summary

- There are many other methods available in Pandas to ingest data:
 - Google Big Query
 - SAS files
 - Excel tables
 - Clipboard contents
 - Pickle files
 - <http://pandas.pydata.org/pandas-docs/stable/api.html#input-output>

pandas: Descriptive Statistics

Twitter: #UCSDpython4DS

describe()

- Syntax : data_frame.describe()
- Output: Shows summary statistics of the dataframe

```
ratings['rating'].describe()
```

```
count      2.000026e+07
mean       3.525529e+00
std        1.051989e+00
min        5.000000e-01

75%        4.000000e+00
max        5.000000e+00
Name: rating, dtype: float64
```

corr()

- Syntax: `data_frame.corr()`
- Computes pairwise Pearson coefficient (ρ) of columns
- Other coefficients available: Kendall, Spearman

$$\rho_{X,Y} = \frac{\text{cov}(X, Y)}{\sigma_X \sigma_Y}$$

Covariance

Standard deviation

```
graph TD; Cov(Covariance) --> Numerator[cov(X, Y)]; StdDev(Standard deviation) --> Denominator["σXσY"];
```

func = min(), max(), mode(), median()

- The general syntax for calling these functions is
 - `data_frame.func()`
 - Frequently used optional parameter:
 - `axis = 0` (rows) or `1` (columns)

mean()

- Syntax: `data_frame.mean(axis={0 or 1})`
 - Axis = 0 : Index
 - Axis = 1 : Columns
- Output: Series or DataFrame with the mean values

std()

- Syntax: `data_frame.std(axis={0 or 1})`
 - Axis = 0 : Index
 - Axis = 1 : Columns
- Output: Series or DataFrame with the Standard Deviation values
 - Normalized by N-1

any()

- Output: Returns whether ANY element is True
- Benefits:
 - Can detect if a cell matches a condition very quickly

all()

- Output: Returns whether ALL element is True
- Benefits:
 - Can detect if a column or row matches a condition very quickly

Summary

- Some other functions that are worth exploring:
 - Count()
 - Clip()
 - Rank()
 - Round()

pandas: Data Cleaning

Dr. Ilkay Altintas and Dr. Leo Porter

Twitter: #UCSDpython4DS

Real-world data is messy!

- Missing values
- Outliers in the data
- Invalid data (e.g. negative values for age)
- NaN value (`np.nan`)
- None value

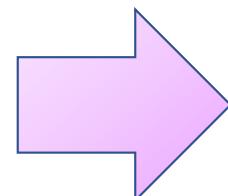

Handling Data Quality Issues

- Replace the value
- Fill gaps forward / backward
- Drop fields
- Interpolation

- Identify key plotting functions of Pandas
- Recognize the ease of utilization of native Pandas methods (for e.g. with DataFrames)

pandas: ParsingTimestamps

Dr. Ilkay Altintas and Dr. Leo Porter

Twitter: #UCSDpython4DS

By the end of this video, you should be able to:

- Explain what Unix time / POSIX time / epoch time is
- Describe data types for datetime
- Select rows based on time stamps
- Sort tables in chronological order

Unix time / POSIX time / epoch time

- Number of seconds elapsed since
 - 00:00:00
 - Coordinated Universal Time (UTC),
 - Thursday, 1 January 1970
- Prominent in UNIX like systems
- Parsing Timestamp: We have to read POSIX time and understand what the exact time stamp was

Data Types for Timestamps

- Generic data type: **datetime64 [ns]**
- Convert int64 timestamp to <M8 [ns] or >M8 [ns] on your machine

```
tags.dtypes
```

userId	int64
movieId	int64
tag	object
timestamp	int64
dtype:	object

```
dtype( '<M8[ ns ]' )
```

Convert Timestamp to Python Format

to_datetime()

```
tags['parsed_time'] = pd.to_datetime(tags['timestamp'], unit='s')
```

```
tags.head(2)
```

	userId	movieId	tag	timestamp	parsed_time
0	18	4141	Mark Waters	1240597180	2009-04-24 18:19:40
1	65	208	dark hero	1368150078	2013-05-10 01:41:18

Select Rows Based on Timestamps

```
greater_than_t = tags['parsed_time'] > '2015-02-01'
```

```
selected_rows = tags[greater_than_t]
```

Sort Tables in Chronological Order

```
tags.sort_values(by='parsed_time', ascending=True) [:10]
```

	userId	movieId	tag	timestamp	parsed_time

333920	100371	32	bruce willis	1135429442	2005-12-24 13:04:02

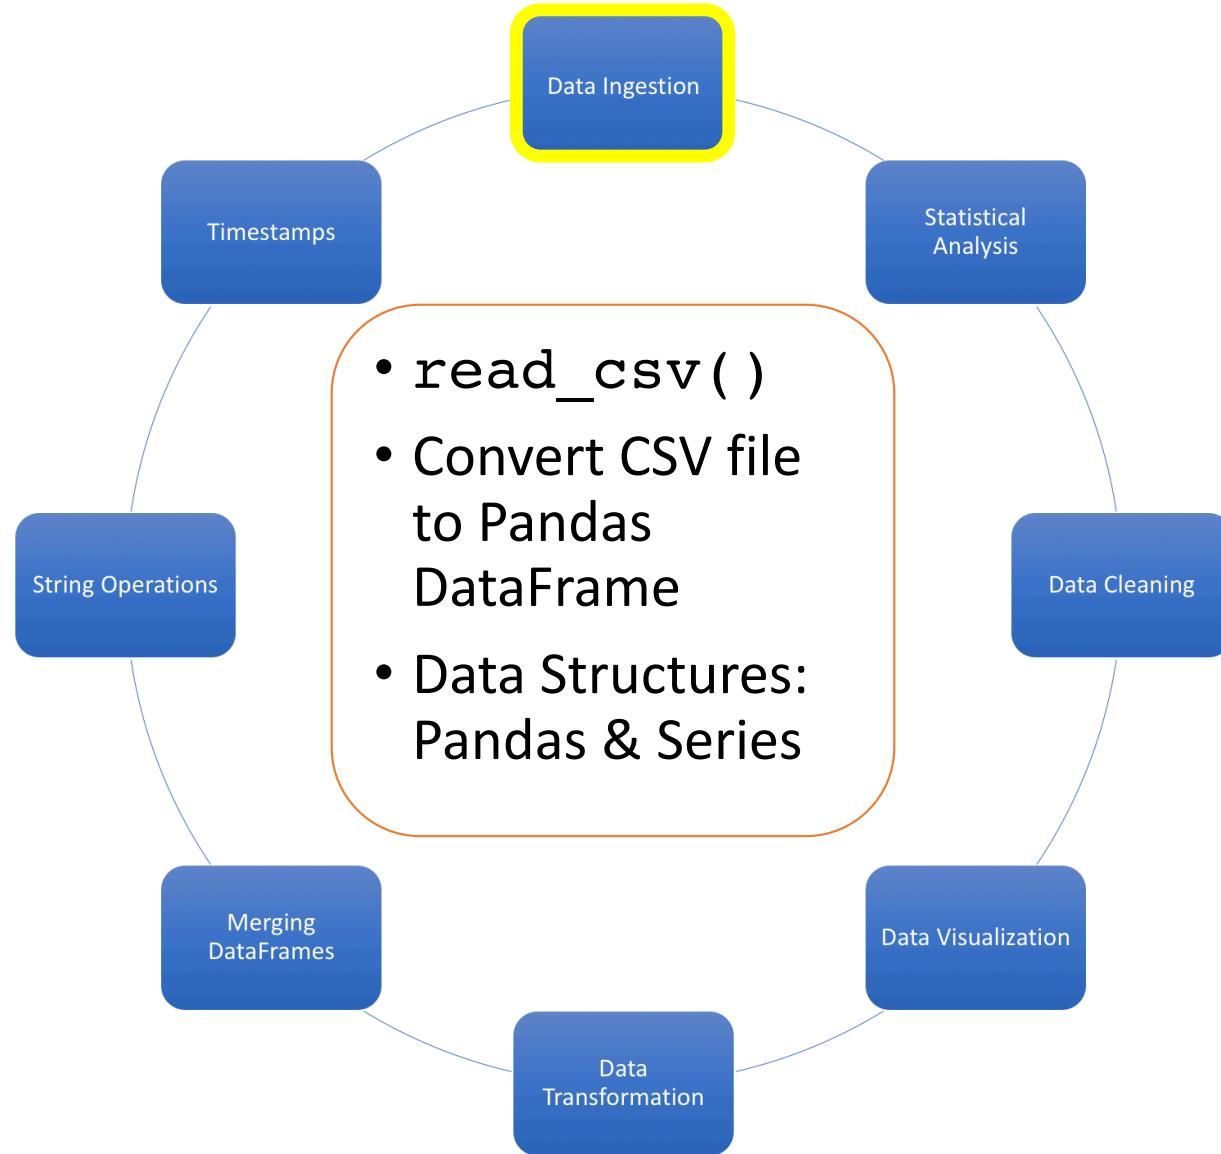

Summary

- POSIX / Unix time can be hard to read for users
- Converting to Python datetime format gives practical ways to:
 - Select data based on human readable time stamps
 - Create conditions using understandable time stamps
